

*Finally, Cost-Effective Data Security...*

## **Enterprise Security Solutions (ESS)**

*ESS* is a professional consulting firm specializing in securing data networks from external hackers and insider theft and misuse. *ESS* is committed to providing the highest level of information security services. We partner with our clients to evaluate and prioritize their network security needs and develop industry “best practice” solutions to safeguard the confidentiality, integrity and availability of their company and customer data.

The partners at *ESS* are senior level information security professionals with an average 25 years of networking and security experience. They hold a range of internationally recognized certifications, including CISSP, as well as high-level government clearances. Unlike other consulting firms, the people who arrange and coordinate our services with you are the same people who perform the work. Your organizations’ needs are evaluated not by a marketing representative but by an experienced security expert.

*ESS* offers senior security consulting at rates substantially lower than that of the competition. We provide senior consultants who have the experience and expertise to provide superior service, while keeping our administrative overhead and layers of management to a minimum. We also like what we do and it shows in our deliverables and level of customer satisfaction.

*ESS* consultants have performed security consulting assignments in the banking, financial, pharmaceutical, telecommunications, utility, transportation, manufacturing, and government sectors. We can help your organization comply with legal and regulatory requirements of GLBA and HIPAA, as well as due diligence recommendations of standards like ISO 17799.

We pride ourselves in being vendor-neutral, partnering with your information technology staff to develop the right mix of tools and strategies to meet your data security needs, mindful of your budget realities and constraints. In many cases, we can help your organization substantially improve your computer and network security without significant capital investment.

At *ESS*, it is not our objective to sell expensive products, or change the way you do business. It is the goal of Enterprise Security Solutions to develop workable, cost effective solutions that will enhance the security of your networks and marketability of your products and services. It’s your data and your business. Let us help you safeguard it.

*(over...)*

A typical *ESS* assessment will include:

- Corporate security policy review
- Architecture review
- Router configuration analysis
- Firewall configuration analysis
- Host operating system configuration analysis
- Application configuration analysis
- Database configuration analysis
- Network vulnerability assessment
- War dialing

When performing web penetration testing, we not only test for operating system and web server vulnerabilities, but also review the application and examine the user/server interface. We evaluate both untrusted and trusted user access and the totality of web exposure.

We can also work with your IT staff to train them in security techniques and countermeasures. We can show them how to identify unauthorized network activity and to respond quickly to that activity to limit the impact on your critical infrastructure. We can recommend intrusion detection systems (IDS) that will alert you to potential damage before it happens. ESS can help take the mystery out of information security and provide your staff with the knowledge and tools to provide security self-sufficiency.

For additional information about our comprehensive network security services and solutions, please contact *ESS* at (866) 563-6362 or [Info@EnterpriseSecuritySolutions.net](mailto:Info@EnterpriseSecuritySolutions.net).

*The largest impact of a security breach is not the expense to repair the data,  
but the cost of rebuilding your customer's confidence.*
